

Ontology-Based RDF Integration of Heterogeneous Data

Maxime Buron, François Goasdoué, Ioana Manolescu, Marie-Laure Mugnier

EDBT 2020

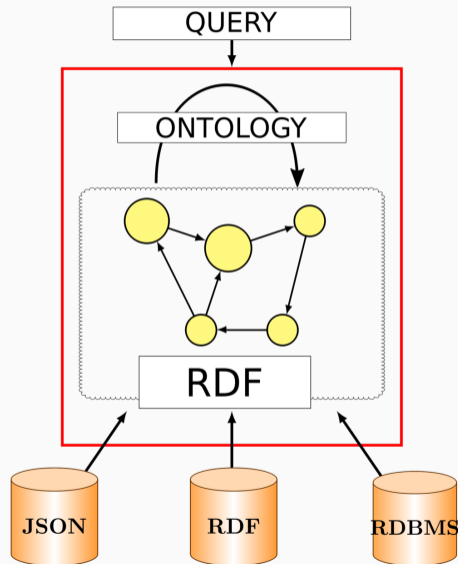

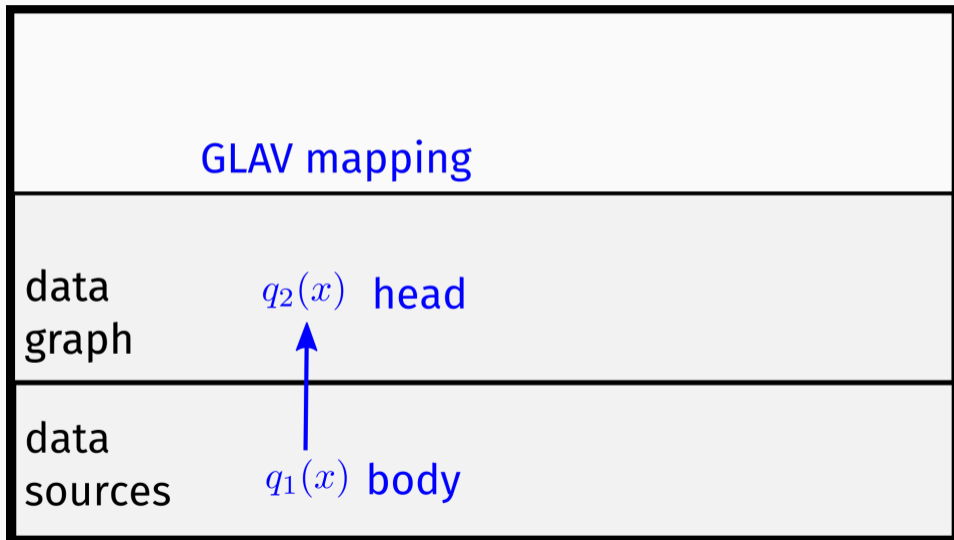

Context: Ontology-Based Data Access

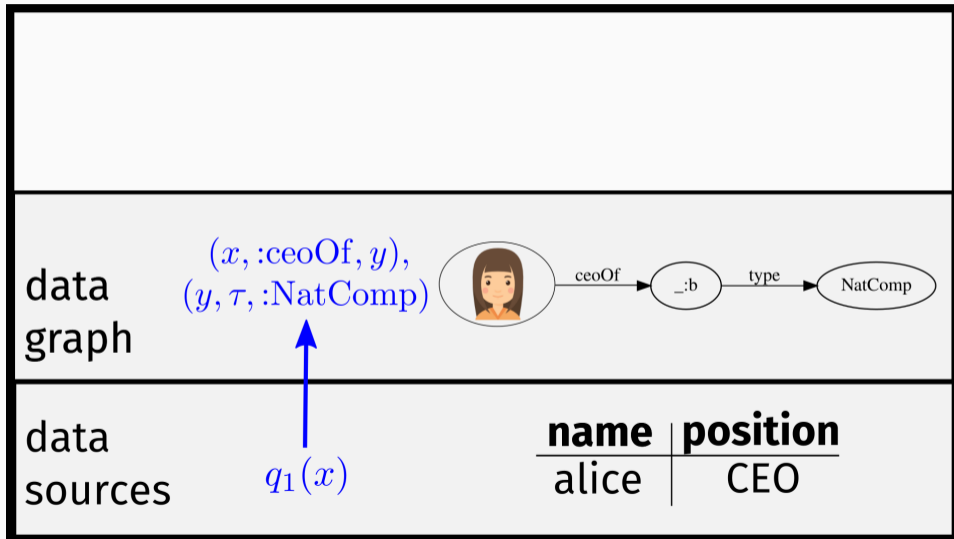

Contributions

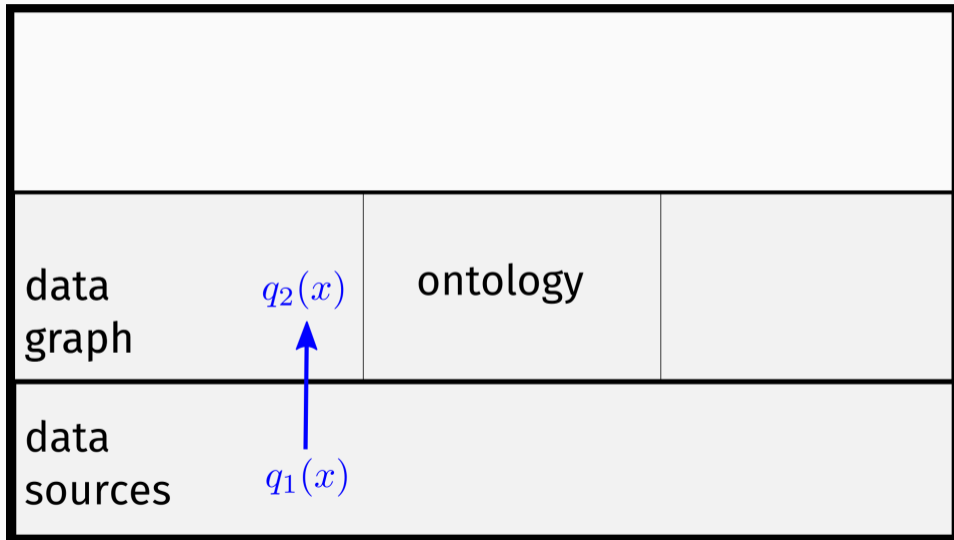

1. More powerful integration setting:
 - Global-Local-As-View mappings in an OBDA context
 - Queries on the data *and* the ontology
2. Two novel query answering methods:
based on the amount of reasoning performed *offline* and at *query time*

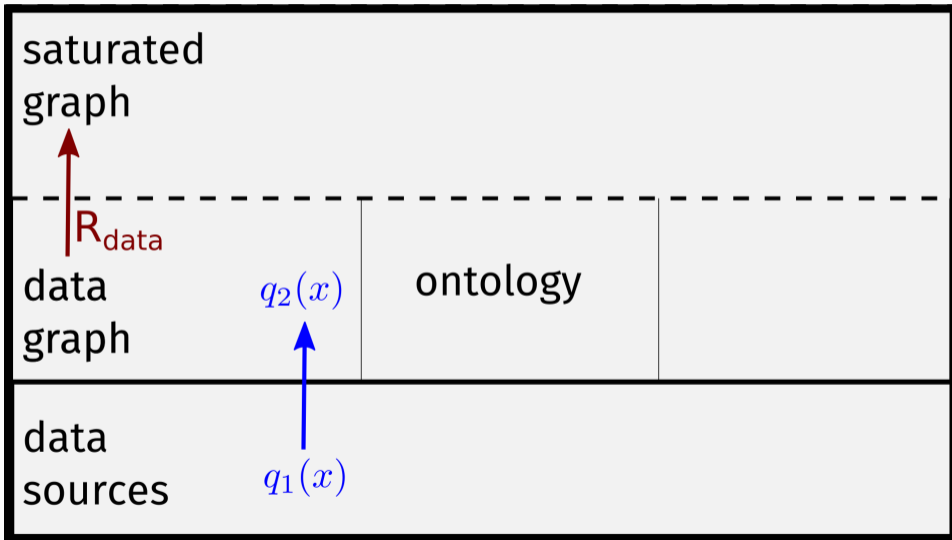

Global-Local-As-View Mapping Example

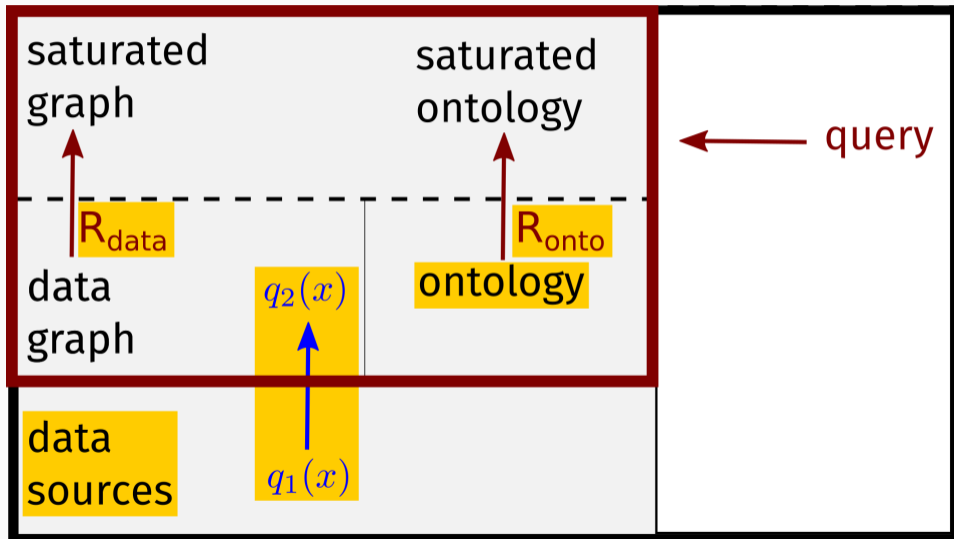

RDFS Entailment of Data Triples

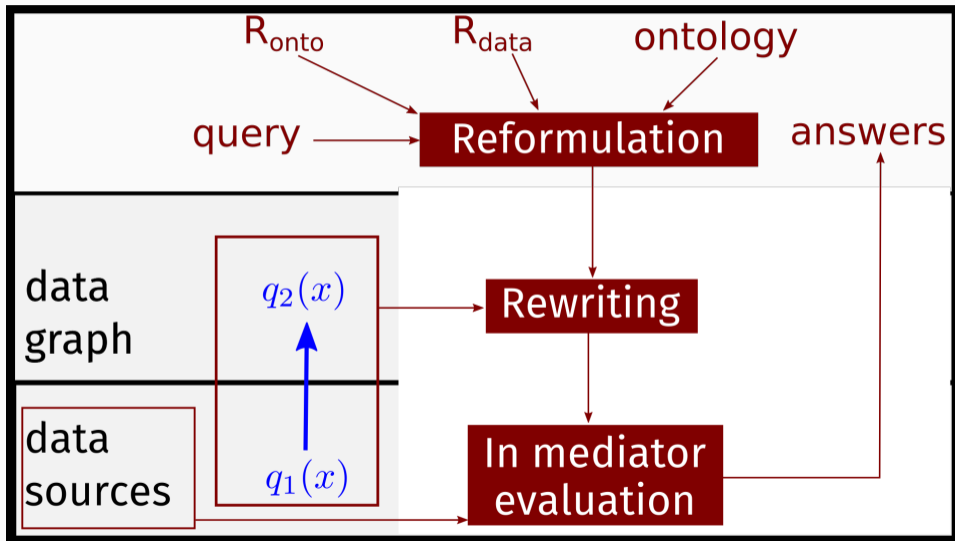

RDFS Entailment of Ontological Triples

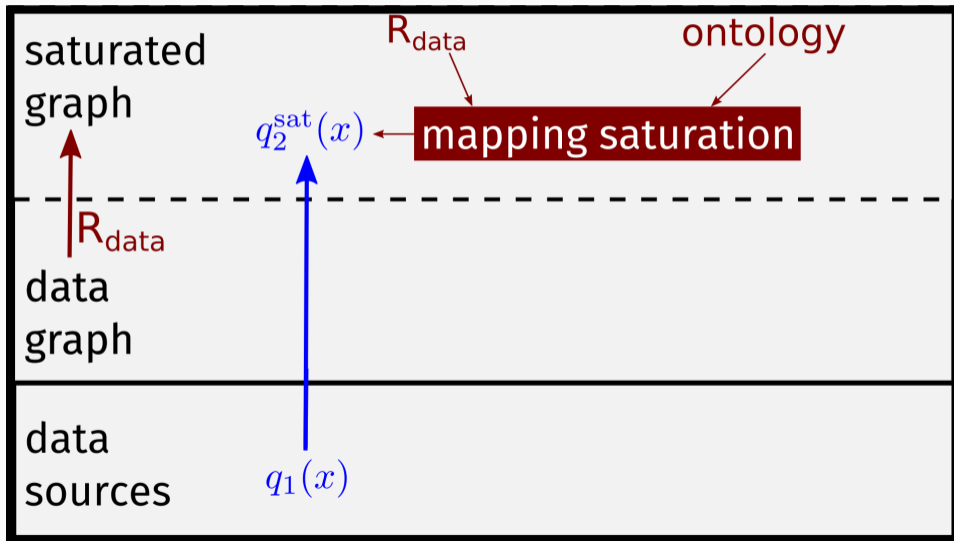

Query Answering Problem

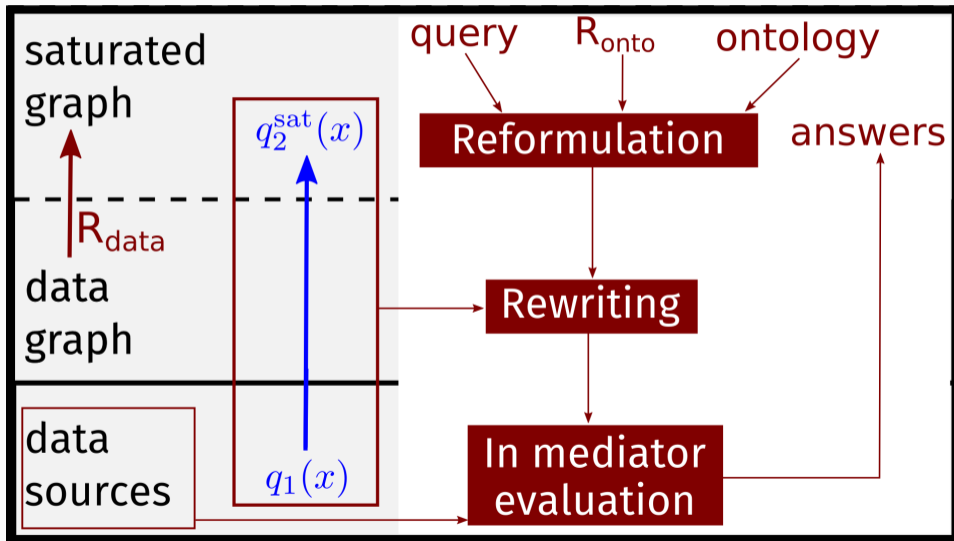

Classical Method: *All Reasoning at Query Time*

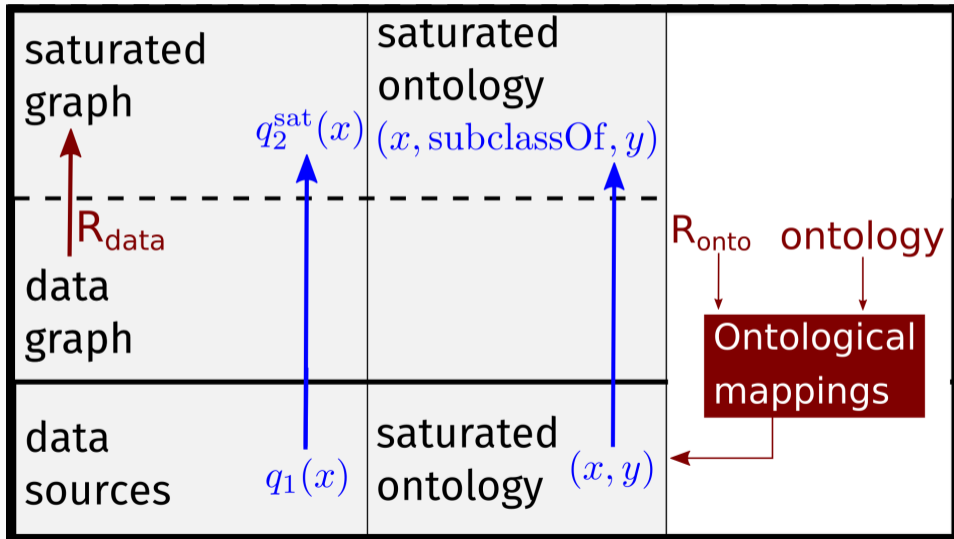

Some reasoning at Query Time Method: Preprocessing

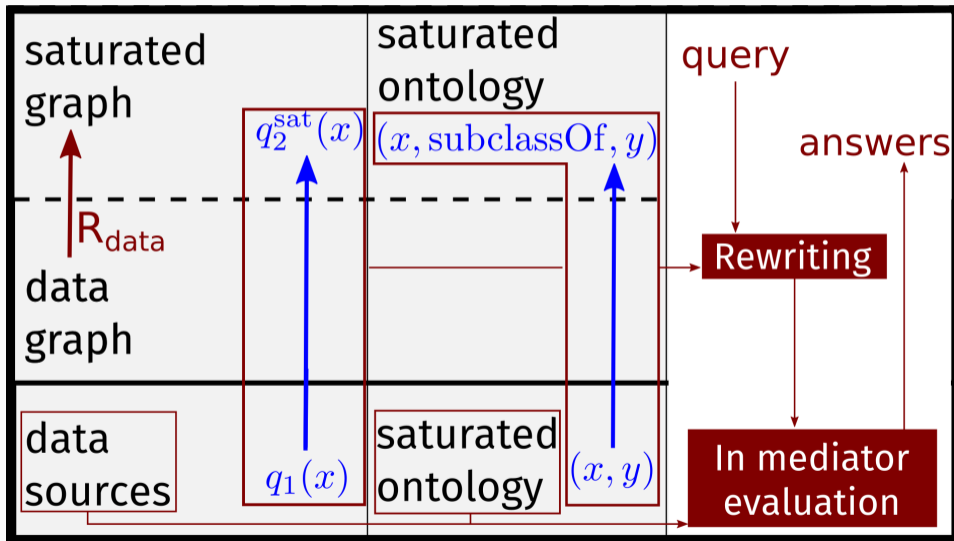

Some reasoning at Query Time Method: Query Time

No Reasoning at Query Time: Pre-Processing

No Reasoning at Query Time: Query Time

- **Software:**
 - *OntoSQL* (reformulation and materialization)
 - *Graal* (rewriting)
 - *Tatooine* (mediation)
- **RDF Integration System:**
 - Extension of BSBM
 - 3863 GLAV mappings
 - RDFS ontology of 2011 triples
 - Induced graph with 108M triples (185M triples when saturated)
 - Two data sources: One **relational** and one **JSON**

Query Answering Times on Heterogeneous Data Sources

- Materialization (MAT) - kind of reference time
- Full reformulation + rewriting (REW-CA)
- Mapping saturation + partial reformulation + rewriting (REW-C)

- **Global-Local-As-View mappings** in OBDA Context
- **Queries on data and ontology**
- A new **scalable query answering strategy** using partial reformulation and saturated mappings
